XRen QRCode is a simple and lightweight application that displays a user-friendly interface, which is suitable for any kind of user. First of all, you have to select the operator you want to use to create the QR code. If you do not want to use one, you can always select 'None'. Otherwise, you can choose from several character encoding types, each one of them allowing you to fill in a certain number of fields for encrypting. Among these, you can find contact details – name, phone number, addresses, as well as email message content and sender. Other encrypted information can include URLs, business card details and so on. When filling in all the text information, you can encode it into an image that you can also preview. But you can also reverse the process: if you have a Quick Response code that you want to decode, you simply have to make a snapshot of it. Nevertheless, you have to make the snapshot at the full dimension of the QR code image, otherwise the software cannot read the containing information. With a single click, XRen QRCode automatically decodes the information from the QR code, allowing you to view the hidden data. Saving, copying and printing are also supported. As QR code usage is currently expanding, becoming more and more present in stores and on the smartphone market, XRen QRCode can come in handy when you need to decrypt image codes.Perioperative Outcomes for Primary Total Hip Arthroplasty at an Integrated Health System in a Rural Setting. This study compares perioperative outcomes for primary total hip arthroplasty at an integrated health system in a rural setting in the United States with those reported in other literature. These analyses included a retrospective review of 3,958 primary total hip arthroplasties (1,740 and 1,818 with and without autograft bone) in patients treated from 2001 to 2009. Patient demographics, hospital stay, discharge disposition, mortality, and readmissions were compared with national benchmarks. Within the study period, there was an increase in primary total hip arthroplasties and use of regional anesthetic techniques. The mean length of stay was 3.5 days, and 2.9 days for patients without autograft bone. There were no differences in discharge disposition, readmission, or mortality compared with the national benchmark ($P > .05$ for all). There were no differences in mortality compared with national benchmarks for readmissions and discharge disposition ($P >$
